It is good. It is in depth being in both bodies. Why did you do this? The hair has been too distorted. What in the lens? Why did you do this? You say it will be a... This is nothing wrong. I said, don't do both three sessions. Will you go first too? Just say, "This is something wrong. I said, "Don't do putry sessions, will you go for us too?" Just to settle up the last part. How? That you remember, no? How is the last thing? We'll get there. How am I speaking with the W? Why did you do this? I didn't even hear that. Anybody can answer. I could speak all of you. Fokki, you have to do it. The cousin said first, "Dude in search" right? Only he talked about it. He is getting this. So, there is another thing she has done that. Yeah, no. The main stuff, because he would practice any way to whatever, but he would be dreaming. Like, sad is there something that sometimes, for the best of that, whatever the mean of the you mean whatever market is a dream, maybe it's like a scientist or something, but sometimes it's all based on whatever the means of the like value user that makes it so good. Now that it's clear, so you knew that few of the modules you would want to develop and which are the ones which are contemporary which are available in much standard products outside, which would be used in a various customizable way. But most of the consumers whenever they are trying to use based on the geochemical is this one. Correct. Which are those competitors you analyze? I guess that what I am coming to is that you should not think about energy. Then what is not present clean energy? It should not be the evil one percent. So, we have the amount of the inside the bank bond. Then, we have a test equation and the information only is called the test. Majority is there. So, let us try to explain the market research. Let us try to understand the unknown zone. We always work in the non zone. In that I know that I don't know and then if I know what is there we do not have it and find the fitting and join the person. When I am conditioning is that first we need to start unlearning. Again, it will be summer game before we get into using the unique glorious amount of panda, panda, panda, panda, panda, panda, panda, panda, panda, panda, panda, let us let us be practical why we are doing it and I will still not open the presentation and send you take us to the place. So, we will need to completely unlearn few things and work in space where we don't know. How can that happen? We should be inquisitive of what we should be clear about how we are setting up the context of the script or told about setting the context while using air tools. So it will be our one word in member, but it can say it can read 200 pages in 10 seconds for which we would need say a week. Additional capabilities that it can search 10 websites in one meeting where we will need it to be for a segmented 2 to 3 hours. If you initially build with this as the initial capability of context setting, you should be clear about what kind of context we are getting. We should know now this one, this, this, this very good style. Who are you? Who wants to know this? When we say we are designing another thing to point out, who are the main stakeholders who would be defining the product? You will have a business and you will have a product manager. You will have an architect, you will have a testing strategy vehicle. Let us let us let you make the three of four personas. All of these and then you have the sign of authorities over here. There is a further sign in all the all. You say they are in like. Now these four of five personas, they would want to think in different way, their needs will be different. When they come into the context it will be different. Right? When the market research happens, do you need an architect to come? Do you need a testing strategy or a QA lead to come in place? You do not need them. Do you want a VA to be in place? Maybe yes. Do you want a product manager to be in a 100% yes. Right? So in those contexts, how are you going to build it? What are yesterday we spoke about building these in phases? Then coming to what was the next output of market research. We will be getting into proper business requirements. Now that is when the product manager as well as the BAs will work together and come across with that document but that till that time all the noise should have been eliminated. So it is always good to add more and delete later. Delete later. Do not when you use LLMs, any LLMs, don't use it like Google. This you may have got hundreds and thousands of time, but we still end up doing that. Because we will ask the question where we want to come. When we say you build a context, but that is within a quantity. You should help it crawl wider, but within that context. And then you say that, "Who you are, you're looking at research, what is that your background here, that the data right upon the app, this is what you are understanding of your ecosystem. Who are you as a product manager? This is the relapse, these are the main different things what you want to enable. You have searched within the context together, the help is spread wider and then app will remain equal. Then refine it, refine it, refine it, refine it, then ask the right question. That time it will be much more to the precise point, we will do it and so on, it will get easier to say understand but let this theory be in your mind. So from that point of term to onwards, now Claude has a project context. Claude has a persona context, Claude has any other. Any other. Any other. It has a context of a persona. It has a context for how to think and what the thing can about it. But more importantly, we will also get it. learn what not to think, this is not your job, I don't care about this. Where it should not go outside your context area, where it should remain context. So now things are moving from front engineering, now it is time that people are doing in two contexts in here. It is one level up, because front engineering is still a commodity. If you use it now and write your own skills. You need not include the skills of anthropocore openly. You can write your own skills, you can add it across, you can make it refined, make it thing only towards it. But that is when we come towards the set. But while research, we still are entering into an unknown area. We will be after doing all this, we come and design 10 percent, move with the know what we have right now. That is the purpose. Notifies the purpose. So you should be in a way say tire one company style to Understand

what I want to think that with regards to features with regards to their users with regards to their scope of features or the number of View number of users number of modules nature of users, which is the how is itself important branded companies, is itself a regular companies entire basically, it is only done, it is in domain specific, is it only for I am not, is it only for manufacturing, is it only for utilities? So then it uses a good landscape of what is already existing, do you want to of what is already existing. Do we want to do what is already existing now? But we still would want to generate it from that. Then we have a legacy management. From that, what we do? We can create a question here. We can create an interactive mechanism where we can ask our own internal stakeholders. So you have to make them, you have some biosh, you have others who have been working in external parties, we have our own concept and show our work outside, we have utility heads who have been working in various places rather than going then we are planning to re-vanper here, we put our the event where we have put all your sessions. And to whatever you want, but blessing. But if we are defined saying that these are the major features on the usability aspects of it and for the implementation aspect of it, we can generate it in the scale of 1 to 5. It's a better way of [BLANK_AUDIO]

Source Transcript: transcript1.txt

I have given you a picture of the final product, what we are going to achieve. But that is, let that not be bi-ali, that is not what we want. But those are things, what I have seen as a product is, and which has helped me. Making it more modular, making it more structured, making it more configurable. The thing, as a designer, when you are defining a product itself so that you will not like in the whole world's nature. So, all of these things when you bring it in, we give it to a customer and need a script percent of whatever he wants to do. Only then becomes vectors and it is doable. If so many times, so many times, at some many years of data has been both, because of it, it is important to me. What we are having? Let's take it to the next level. So finally, output of this research will be a product definition, not a product definition of market research research for features. As I told you, let us go, why? Get into a very medical structure, deleting what you have, or put a good type of class. That is bringing it, that is context. Otherwise you start going, you will never, when you go and ask it what you want. And I will all use it in the team's account for all the reason the individual account Because you can create a project. Yeah, so now this one, this one let them do individually. Once you are comfortable doing this context because now you will explore, you do whatever you want because on that and tomorrow's session will be only each one of you is threatening 5-5 minutes about how to invent and what is your output? I am going to do that in the lower level. It's still right. Let them, let them, let them. Otherwise, they will get stuck. When you come there, that skill becomes your primary key and you will not, will naturally not think beyond it. I hope you understand our organization. Ah, ah, ah, these are the spotlights now. This will come with, ah, definitely. 5, 5, 20 minutes and next 25 minutes, ah, I will let you know about how, how we create projects, what the optimal way to do, what are the various way to do what are the various phases what we are trying to do? I will share the repeating advance of course, like I will share. But your point is that you try to do it on your own. This is a good starting point, but each one of you should have done it. Don't rely on each of this. Every output is different. Now when we say project all of these, now it is like four different brains working. I told you about personas, right? Someone thinks like a being, someone thinks like a product manager, someone thinks like a project manager, somebody thinks like an architect, somebody thinks like a QV. All these are skills. Some of these like subject matter expert in one of those modules. So, when we create project all of those should get accumulated in the project context. Then you all will be working on one project, but different tasks tasks but the context will be there then we will start looking at how do you mean the large ones what are got ending files what are rules what are gates what are contracts. Then once we have business requirement document and when we are moving the pharmaceutical requirement document at that time it will be only taken. In that time we have some space to be a general. But let us not move away from whatever we are doing. Here context is clear. There is enough thing to do. Use Q words like brainstorming storming, product definition, priority while you are prompting you to give you few better context. Finally how you can make use of input skills, it is easy not too late. It's not too late. But do not use it now. You'll get biased. Use it when you actually know the whole cycle. Otherwise, you have to do it again. You'll reach there, but you'll have missed the far. Yes. Yes. So then, you want to let them do it. Yes, Yes. So then one or the other one is, you know, do this. Okay. Yes. Our five is up. Each one up, you have five minutes only. Twenty. The half, that pretty privilege is mine. Hmm? Yes. Please talk. You can take a couple of hours. Yes. That's not the same. Hmm? But to do. Yes. Yes. Yes. I am not going to be there. I am not going to be there. I am not going to be there. I am not going to be there. I am not going to be there. I am not going to be there. I am not going to be there. I had my hair. Now I did. No question, if there is no question, if there is no question, it only means only that a thing has been understood. It can be that you can have the same. When I myself know that whatever full you know what I am saying is not fully correct. You should have correct. I am afraid of the same. Actually, it is totally hard. We have no meaning of this. Just follow your mind. Because you tell your mind. I know it is very hard. So, you know it is very hard. Because you tell your mind. I know it is very hard. I know it is very hard. So, I know it is very hard. I know it is very hard. So, I know it is very hard. So, I know it is very hard. Then I know you know it is very hard. I know it's important. So, I don't like that. Then I am not going to do that. I am going to give you. He should let it online. I will give you. I will give you the position of you. I will give you the position of you. Why it is too easy? Why it is too easy? You can ask now. What was your status question? It is as today not. The Indian is not there. You are going to go. In the study, in the clinic, what we are going to do, what is the way we have to go? No problem. But in the company, we are going to do. The question is that when we say a problem statement, you are jumping to how? How should I come prepared tomorrow? That is your first question. Do not get in there. Condition yourself as to not to answer that how far? How far to happen? In Chinamashura, the other one you do. That will happen. Try to understand the values, it is easy but it is tough. But do not think about how to do it, we will un-it-person, I am sure, I am very sure we We will design the next spec. 100% I am very clear. Very clear. I will not do it. We will do it. Last week we were in the entire site last week. Last week C and Nambaya were having some ratings. I am not able to separate this. I am not able to separate this. It is easier than I am. I am not totally afraid of it. I am not able to separate it. I am not afraid of it. I do not know what it is about. I am still able to do those things. I am not sure what the robot is. That will happen. That is an outcome. The moment you see that it isMM will not wow, no, that's not a point. This foundation is the class, because that point onwards basically where we are moving, we are not moving here at the given level. Now, I still always say that you use the word AI assisted it is only an assisted. People say AI with the government yet it is not possible yet it is tomorrow it can weigh out things achieving the race or it is the only way. What we need today what we spoke today to next day, we will just say if you look into plot we will have five models and so on next 5 was one of the best class today that is one of the key principles. So, you will be not available in India now there will be an Indian name for the left and right. the So, you know what I like in the field? So, for the market, there is an output, there is an input, so in the number of points you can write, there is the problem in the dump it, we

do real context and people are always, which is the option. But, for just the moment, let's go. Market research of an ERP product. ERP and it also includes your equipment status. Everything, actually, it will actually do it in the industry. It will actually do it in the industry. What is that you need to prioritize, which are the must-haves, which are good to have, which are good to have it. We will come back to that later. But as the ERP, the does he have to sound to you? I don't know. But he has for energy seen, you can give 10 months. He said what he wants to know. We will be do all. But we also want to know how and what are the best things which are there, what is there, there is a thing who is using it, where is it used? What kind of companies use it, what is the scale of that, what is the relevance of it, just because it is going to be happening. You know, all those data points will come, I believe in data. We analyze and generate data points out of this specific data points, matched to whatever, we add in that what you data points are the ones which has features which are available in 80% of the out of the box products which are available in the market. So this may get into a must have a we have data What happened? Yes, okay. Okay. Here, right? No motions, you can ask me the new place. Please, do this and my first time on what self is very first on call and will not be that first. Okay What's that and I will show you.

[illegible]

yes, I am going to be confident that the last one is in the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. In the middle. We will not be able to learn. It's not a coaching session. And it's not that I know I have learned this idea. I'm literate only. I have not done any additional thing. I am literate. I can read. I can't write. So it's... And the reason I told you is to me the result I get a chance to learn along with you guys and we get a chance to build a product or we can enhance or we can take it. So, there is something creative which is going to come out of it, it is not that it is an academic thing. We would see this thing in production that is why there is lot of learning which we can do more than that is lot of money what we have done. That's when I'm in the last few minutes, it's definitely a time coming. Even though it's been pushed for a free, but I want it to be a bit more casual, it's not before. In the end in life, then what is in your mind? Do you understand what I mean? You have to go and understand what I mean. You have to go and understand what I mean. I don't know. Then you just stop and then you then you're talking English. You tell. You don't worry. You don't worry. You don't worry. We are here to learn together. We don't know anything. It's you guys know. You have been working on an energy, you have been working on air. You know much much more than what I know. I'm just trying to come and learn and then try to create it in a different perspective. Nothing more. There's no rocket science in creating a new, how much can a purchase this model will be different? How much can purchase what it is? But efficiency can be more reductability, more stability can be more. Is there experience? Ah, we have the experience. Confugation, configuration, configuration, everything, all of those things then we look into it. Because the whole workflow, how much of a workflow can you change in a purchase? How much of workflow can you change in a purchase model? How much of a workflow can you change in the inventory? Hardly 10% to 20% leave as you have. You compare any product. And not a workflow, some people may be 10% 20% different. Where you can be creative from what is not there. But what you can bring onto the table is quantum-related thinking. You can bring make the product stable, product reliable, lesser support, making more configurable, This quantum-relertaining can bring make the product stable product reliable, less support making more comfortable, make it more scalable, have it more concurrent users coming, make it more modular, where intermodal dependencies is pretty well established, how those modules can be worked independently. All of those things make the, we can have a better product designer, which other than project business, which they are reinventing the way. In that aspect, what you guys know, in the present year, please, under-tax all of them are done. Because I have never worked. That is the context here. So what can we start now? No, it is not in this way. Yeah. Now this direction will be what kind of research you are already at. Now the output is you have a picture of the output voltage. I need a matrix say it shows as a BCD N/Z, I do not do not name it, what are various multiple features what we go.
